

PRODUCT DESCRIPTION / ENGLISH

More possibilities for the winter season.

LCG AlpSNOW is being developed as a mobile, modular surface system for selected winter and snow-sports areas. Clearly defined pilot areas are intended to be assessed with operators under practical operating conditions.

Concept visualisation: a possible AlpSNOW application on a learning slope.
Right: symbolic illustration.

01 Priority areas

Possible locations include learning slopes, ski-school areas, connecting routes and areas around lower lift stations. Use and location guide the planning.

02 Trial objectives

Trials will examine temperature behaviour, usability and potential additional operating days, together with water, energy and maintenance requirements.

03 Learn together

The test area, responsibilities and measurable objectives will be agreed jointly. Results should support a decision on a possible extension.

Your area. A joint trial.

For lift operators, ski resorts, ski schools, hotels, resorts and tourism municipalities. To start, please share the location, approximate area, current use and the main operational challenge.

AlpSNOW is under development. Operating limits, safety and necessary approvals must be assessed in the pilot. No specific season extension or savings are guaranteed. Technical details are discussed directly.
